## Office Action Summary

Application No.

09/851,725

Applicant(s)

YEH ET AL.

Examiner

Greg Bengzon

Art Unit

2144

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 18 August 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-26 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-26 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### Attachment(s)

### **DETAILED ACTION**

This application has been examined. Claims 1-26 are pending .

#### ***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 08/18/2005 has been entered.

#### ***Priority***

No claim priority has been made in this application.

The effective filing date for the subject matter defined in the pending claims in this application is 5/8/2001.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-6, 9-14, 17-20 (as amended) are rejected under 35 U.S.C. 103(e) as being unpatentable over Fletcher et al. (US Patent 6269401) hereinafter referred to as Fletcher, in view of Yu (US Patent 5636371).

With respect to Claims 1-6, 9-14, 17-20, Fletcher substantially discloses the features and limitations as described by the Applicant.

With respect to Claims 1, 3, 9, 11, and 17 Fletcher discloses the method, set of instructions, and system for testing a computer system to be operated in a multi-computer environment, comprising: executing server code at a computer system under test; executing client code at said computer system under test; and calculating performance data for said computer system under test. Furthermore, Fletcher discloses the method, set of instructions, and system for testing a computer system to be operated in a multi-computer environment, comprising: executing server code at a computer system under test according to a multicomputer communication protocol; executing client code on said computer system under test according to said

Art Unit: 2144

multicomputer communication protocol; and calculating performance data for said computer system under test operating as one of a server and a client. (See Fletcher Column 3 Lines 30-60, Figure 1 Column 5 Lines 15-50, Figure 2 Column 5 Lines 55-67).

However, Fletcher does not disclose (re. Claims 1, 3, 9, 11, 17) a single computer system emulating a server and a client, said computer executing server code and also executing client code.

Yu discloses (re. Claims 1, 3, 9, 11, 17) of a virtual network mechanism that allows a single host system to emulate multiple server and client processes, allowing data to be passed between said processes, and executing server and client code in the same said host system. (Column 4 Lines 1-25, Column 5 Lines 1-25, Column 8 Lines 1-25)

Fletcher and Yu are analogous art because they teach concepts and practices regarding capture of data between server and client processes and execution of said server and client processes. At the time of the invention it would have been obvious to a person of ordinary skill in the art to combine the teachings of Yu into Fletcher, such that the Fletcher is able to 1) emulate server and client processes in the same single host computer system and 2) execute both server code and client code in the said host computer. The suggested motivation for doing so would have been, as Yu suggests (Yu - Abstract), to eliminate the need to 1) specify additional protocol stacks and 2)

Art Unit: 2144

provide additional communication hardware facilities for the handling multiple instances of application programs.

With respect to Claims 2 and 10, Fletcher discloses the method and set of instructions of Claims 1 and 9 for tracking an execution time for each of said threads by a processor in said computer system under test; and tracking a number of transactions completed between the execution of server code and the execution of client code wherein said performance data is based on said number of transactions completed over a period of time. (See Fletcher Column 20, Lines 30-60, Column 23 Lines 45-65, Column 24 Lines 1-67).

With respect to Claims 4,12 and 18, Fletcher discloses the method, set of instructions and system of Claims 3,11, and 17 wherein said server code and client code includes a number of threads, the method further comprising: tracking an execution time for each of said threads by a processor in said computer system under test. (See Fletcher Column 20, Lines 30-60, Column 23 Lines 45-65, Column 24 Lines 1-67).

With respect to Claims 5,13, and 19, Fletcher discloses the method, set of instructions and system of Claims 4, 12, and 18 wherein said multicomputer communication protocol defines transactions between said server and said client, the method further comprising: tracking a number of transactions completed between the

Art Unit: 2144

execution of server code and the execution of client code. (See Fletcher Column 20, Lines 30-60, Column 23 Lines 45-65, Column 24 Lines 1-67).

With respect to Claims 6, 14 and 20, Fletcher discloses the method, set of instructions and system of Claims 5, 13, and 19 wherein said performance data is based on said number of transactions completed over a period of time. (See Fletcher Column 24, Lines 5-18, Lines 30-50)

Claims 7, 15, and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fletcher et al. (US Patent 6269401) hereinafter referred to as Fletcher, in view of Yu (US Patent 5636371), as applied to Claims 1-6, 9-14, 17-20 above, further in view of Cota-Robles (US PG Publication 2001/0056456).

With respect to Claims 7, 15, and 21, the combined teachings of Fletcher and Yu substantially disclose the method, set of instructions and system of Claims 6, 14, and 20 wherein said performance data is based on said number of transaction completed over said period of time. (See Fletcher Column 24, Lines 5-18, Lines 30-50, Column 25 Lines 1-45)

However the combination of Fletcher and Yu does not disclose (re. Claims 7, 15, 21) any teachings regarding a scaling factor and said performance data being modified by a scaling factor.

Cota-Robles discloses (re. Claims 7, 15, 21) a scaling factor that is calculated and applied as a characteristic or 'execution state indicator' or 'dynamic priority indicator' of a thread process. The scaling factor can be calculated as a positive scaling factor or a negative scaling factor, depending on the performance data measurements taken for a particular thread. (Page 2 Paragraph 13, Page 3 Paragraph 33, Page 5 Paragraphs 54-56).

Fletcher, Yu and Cota-Robles are analogous art because they are presenting solutions for measuring thread execution data and using the performance data for calculations that describe characteristics of thread execution dynamics in a computer system environment. At the time of the invention it would have been obvious to a person of ordinary skill in the art to apply the concept of a scaling factor taught by Cota-Robles and use the scaling factor to modify the performance data measured by the combination of Fletcher and Yu. The suggested motivation for doing so would have been, as suggested by Cota-Robles (Page 2 Paragraph 23), to overcome the limitations of single context processors which execute instructions from one thread at a time, wherein priority-based scheduling algorithms unambiguously determine when and under what circumstances different threads access the processor. Furthermore it would have been obvious combine in order to present a logical means for comparing performance testing results with relative atomicity, consistency, and isolation. Furthermore the scaling factor allows the test conditions to be adjusted accordingly in order to simulate or predict performance under other testing scenarios.

Claims 8, 16, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fletcher et al. (US Patent 6269401) hereinafter referred to as Fletcher, in view of Yu (US Patent 5636371), as applied to Claims 1-6, 9-14, 17-20 above, further in view of Cota-Robles (US PG Publication 2001/0056456).

With respect to Claims 8, 16, and 22, the combined teachings of Fletcher and Yu substantially disclose the method, set of instructions and system of Claims 7, 15, and 21 as described the rejection for Claims 7, 15, and 21. Fletcher discloses measuring the total execution time for both client and server threads (Column 7 Lines 5-67, Column 8 Lines 25-30) and measuring one of an execution time for said server threads and an execution time for said client threads (Column 20 Line 30-60).

However the combination of Fletcher and Yu does not disclose (re. Claims 8, 16, and 22) any teachings regarding a scaling factor, where said scaling factor is a total execution time for both client and server threads divided by one of an execution time for said server threads and an execution time for said client threads.

Cota-Robles discloses (re. Claims 8, 16, and 22) a scaling factor that is calculated and applied as a characteristic or 'execution state indicator' or 'dynamic priority indicator' of a thread process. The scaling factor can be calculated as a positive scaling factor or a negative scaling factor, depending on the performance data measurements

Art Unit: 2144

taken for a particular thread. (Page 2 Paragraph 13, Page 3 Paragraph 33, Page 5 Paragraphs 54-56). Cota-Robles teaches of a scaling function having linear dependencies wherein said scaling function is expressed as a ratio between a sum of the total occurrence for a unit of measurement data and a singular occurrence of a unit of measurement data. (Page 5 Paragraphs 49-50)

Fletcher, Yu and Cota-Robles are analogous art because they are presenting solutions for measuring thread execution data and using the performance data for calculations that describe characteristics of thread execution dynamics in a computer system environment. At the time of the invention it would have been obvious to a person of ordinary skill in the art to apply the concept of a scaling factor as taught by Cota-Robles, determine a suitable scaling function, calculate the scaling factor and use the scaling factor to modify the performance data measured by the combination of Fletcher and Yu. The scaling function can be expressed as a ratio between the total execution time for both client and server threads divided by one of an execution time for said server threads and an execution time for said client threads.

The suggested motivation for doing so would have been, as suggested by Cota-Robles (Page 2 Paragraph 23), to overcome the limitations of single context processors which execute instructions from one thread at a time, wherein priority-based scheduling algorithms unambiguously determine when and under what circumstances different threads access the processor. Furthermore the combination would have been obvious in order to present a logical means for comparing performance testing results with relative atomicity, consistency, and isolation. Furthermore the scaling factor allows

Art Unit: 2144

the test conditions to be adjusted accordingly in order to simulate or predict performance under other testing scenarios.

Claims 23-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fletcher et al. (US Patent 6269401) hereinafter referred to as Fletcher, in view of Yu (US Patent 5636371), as applied to Claims 1-6, 9-14, 17-20 above, further in view of Cota-Robles (US PG Publication 2001/0056456).

With respect to Claim 23 and 25, the combination of Fletcher and Yu discloses the methods of Claim 1 and set of instructions for Claim 9, wherein said server code comprises a number of server threads, and said client code comprises a number of client threads. (Column 23 Lines 30-40)

However the combination of Fletcher and Yu does not disclose (re. Claims 23, 25) of executing scheduler code, said scheduler code comprising a number of scheduler threads, said scheduler threads for coordinating communications of data between said client threads and said server threads.

With respect to Claims 24 and 26, the combination of Fletcher and Yu does not disclose the methods of Claim 23 and set of instructions for Claim 25, wherein

executing said scheduler code includes interfacing with a queue to store data packets to be transferred to a client thread or a server thread.

Cota-Robles discloses (re. Claims 23, 25) of a simultaneous multi-threaded architecture that combines operating system (OS) priority information with thread execution heuristics to provide dynamic priorities for selecting thread instructions for processing. The OS can schedule multiple threads belonging to different applications such as server or client applications onto an SMT processor concurrently. (Page 2 Paragraph 23-27). Cota-Robles discloses (re. Claims 24, 26) the SMT processor using instruction queues for storing data according to which execution unit is necessary to implement the thread. (Page 3 Paragraph 35-37)

Fletcher, Yu and Cota-Robles are analogous art because they are presenting solutions for measuring thread execution data and using the performance data for calculations that describe characteristics of thread execution dynamics in a computer system environment. At the time of the invention it would have been obvious to a person of ordinary skill in the art to implement a thread scheduler as taught by Cota-Robles into the combination of Fletcher and Yu , such that the scheduler is able to 1) recognize and reassign the priorities of the server threads and the client threads for maximum efficiency and throughput and 2) transfer the necessary data to the server or client thread in order to complete execution of the thread. The suggested motivation for doing so would have been, as Cota-Robles suggests (Page 2 Paragraph 23), to

Art Unit: 2144

overcome the limitation of single context processors which execute instructions from one thread at a time.

### ***Response to Arguments***

Applicant's arguments filed 08/18/2005 have been fully considered but are not persuasive.

The Applicant presents the following argument(s) [*in italics*]:

*With regards to independent claims 1, 3, 9, 11, and 17, the Examiner.... has acknowledged that Fletcher does not teach or suggest "a single computer system emulating a server and a client, said [single] computer executing server code and also executing client code." However, the Examiner has taken the position, unsupported by the references of record, that Fletcher can be modified to include such limitations without affecting the performance of the Fletcher system. There is no teaching or suggestion of such a modification in Fletcher. In fact Fletcher teaches away from a single computer system emulating a server and a client because Fletcher teaches*

Art Unit: 2144

*monitoring communication performance in a communication network comprising communication systems communicatively coupled to each other with communication equipment. ... Thus, contrary to the present invention, Fletcher uses separate computer systems for the client and the server.....*

The Examiner respectfully disagrees with the Applicant. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In Column 2 Lines 25-30 Fletcher disclosed that it is not possible to quickly pinpoint a problem as either a network problem or a system problem, and cites an example (Fletcher – Column 25 Lines 40-45) wherein, in resolving a response time issue, the network manager is required to determine if there is a problem with the communication line or with router(s) along that line. It would have been obvious to a person of ordinary skill in the art that in order to create an effective monitoring environment all unnecessary factors that may affect the monitored environment should be eliminated. Thus, Fletcher would have been motivated to look for disclosures regarding environments that permit client and server operations in a single workstation, such as disclosed by Yu. In regards to affecting the

Art Unit: 2144

performance of the system described by Fletcher, the Examiner notes that Fletcher does not indicate any limitation on the type of host computer and operating system that is required to perform monitoring operations. Furthermore Yu provides additional motivation for combination in disclosing that said system enhances overall system performance and eliminates the need for additional resources. (Yu – Column 4 Lines 1-5)

The Applicant presents the following argument(s) [*in italics*]:

*Yu, on the other hand, does not appear to teach this feature as well. Instead, according to the sections of Yu cited by the Examiner, Yu teaches that server processes are run on a remote system.*

The Examiner respectfully disagrees with the Applicant. Yu disclosed that there is no requirement that the emulated systems be located in a physically separate computer system. (Yu – Column 5 Lines 15-20) Thus Yu disclosed a single computer system emulating a server and a client.

Art Unit: 2144

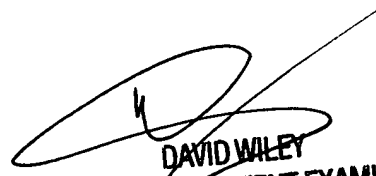

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Greg Bengzon whose telephone number is (571) 272-3944. The examiner can normally be reached on Mon. thru Fri. 8 AM - 4:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Wiley can be reached on (571) 272-3923. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
